1 Explanation of symbols and safety instructions

1.1 Explanation of symbols

Warnings

In warnings, signal words at the beginning of a warning are used to indicate the type and seriousness of the ensuing risk if measures for minimizing danger are not taken. The following keywords are defined and can be used in this document:

**DANGER:**

DANGER indicates a hazardous situation which, if not avoided, could result in death or serious injury.

**WARNING:**

WARNING indicates a hazardous situation which, if not avoided, could result in death or serious injury.

**CAUTION:**

CAUTION indicates a hazardous situation which, if not avoided, could result in minor to moderate injury.

**NOTICE:**

NOTICE is used to address practices not related to personal injury.
Important Information

The info symbol indicates important information where there is no risk to people or property.

*Table 1*

1.2 Safety instructions

⚠️ General information

This manual is available in English and French.

▶ Keep this manual for future use.

▶ Observe the safety instructions of this manual before putting the heating appliance into operation.

If the information in this manual is not followed exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

▶ Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.
What to do if you smell gas
- Do not try to light any appliance.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

Installation and service must be performed by a trained and certified heating contractor, service agency or the gas supplier.

⚠️ If you smell gas
- Turn off the gas shut-off valve.
- Open windows and doors.
- Do not touch any electrical switch, telephone, and do not use outlets.
- Extinguish all open flames.
- Do not smoke!
- Do not use lighters!
- Warn all occupants of the building, but do not ring any bell.
▸ From outside the building, call the gas supply company and a trained and certified installer or service company.

⚠ **If you smell flue gas**
▸ Switch OFF the appliance (→ page 16).
▸ Open windows and doors.
▸ Inform a trained and certified heating contractor.

⚠ **For appliances operating on room air:**
   **Danger of flue gas poisoning if supply of combustion air is insufficient**
▸ Safeguard supply of combustion air.
▸ Do not cover or reduce the size of ventilation openings in doors, windows and walls.
▸ Safeguard sufficient supply of combustion air also for appliances installed at a later date, e.g. kitchen exhaust fans, clothes dryers, and air conditioning units with vent to the outside.
▸ Never operate the appliance if the supply of combustion air is insufficient.

⚠ **Danger of explosion of flammable gases**
▸ Only employ a trained and certified contractor to carry out work on the gas train.
\section*{Risk of scalding}

- If running at DHW temperatures above 104 °F (40 °C) ask a trained and certified heating contractor to install a tempering valve to prevent scalding.

- When the \textit{thermal disinfection} function is enabled, DHW temperatures above 140 °F (60 °C) can occur.

\section*{Risk of damage due to operator error}

Operator errors can result in personal injury and damage to property.

- Ensure that children never operate this appliance unsupervised or play with it.

- Ensure that only people who know to operate this appliance correctly have access to it.

\section*{Installation, conversion}

Only have the appliance installed or modified by a trained and certified heating contractor.

Never modify any parts that carry flue gas.

Never close the outlet of safety valves. Water may be expelled from any safety valve during heat-up.
⚠️ Inspection and maintenance
The operator is responsible for safety and environmental compliance of the heating system. Sign a maintenance and inspection contract with a trained and certified contractor, covering an annual inspection and demand-dependent maintenance. This guarantees high efficiency and environmentally sound combustion.

⚠️ Explosive and easily combustible materials
Never use or store easily combustible materials (paper, thinners, paints, etc.) near the appliance.

⚠️ Combustion air / room air
To prevent corrosion, keep the supply of combustion air / room air free of corrosive substances (e.g. halogenated hydrocarbons that contain chlorine or fluorine compounds).

⚠️ Overheating of the appliance
Should overheating occur or the gas supply fail to shut off, do not turn off or disconnect the electrical supply to the pump. Instead, shut off the gas supply at a location outside of the appliance.
In case of water damage
Do not use this boiler if any part has been under water. Immediately call a trained and certified service technician to inspect the boiler and to replace any part of the control system and any gas control which has been under water.

2  Information about the appliance

2.1  Certifications
This product has been tested and certified for the US and the Canadian market and complies with all applicable standards required for the US and the Canadian market.

2.2  Proper use
The appliance may only be installed in closed loop hot water central heating systems. Any other purpose is considered improper use. Any resulting damage is excluded from the manufacturer's warranty.

The commercial and industrial use of the appliance for generating process heat is not permitted.
2.3 Overview of boiler types

42 Output and DHW output up to 143,300 BTU/hr (42 kW)
-3 Version
A Fan-supported appliance
23 Natural gas (NG)

3 Preparing the appliance for operation

▶ If existing, open the heating supply valve and the heating return valve.
▶ If existing, open the cold water valve and the DHW valve.
▶ Open the gas cock.
▶ Open the control panel cover.

3.1 Checking the boiler water pressure

The standard boiler water pressure is 14.5 - 21.75 psi (1 - 1.5 bar).

Should a higher boiler water pressure be required, refer to a trained and certified heating contractor.
3.2  **Topping up the heating system water**

Topping up the heating system water is different on every system. Therefore, you should ask a trained and certified heating contractor to show you how it is done.  

**Maximum pressure** of 30 psi (2.07 bar) at maximum heating water temperature must not be exceeded (safety valve will spill).

---

4  **Operation**

These operating instructions apply only to the boiler. Depending on the heating control unit used, some functions may vary.

The following options for controlling the heating system are available:

- Room thermostat
- RRC Room thermostat with outdoor reset
- Third party system control unit
Therefore, please read the operating instructions for the heating control unit used.

Page 27 contains a quick reference. You can fold this outward and keep these operating instructions in the control panel cover.
4.1 Overview of controls

Fig. 3
[1] Emission test button for contractors (see installation instructions)
[2] Service button for contractors (see installation instructions)
[3] Burner ON indicator lamp
[4] ON/OFF switch
[5] Key pad lock
[6] ECO button
[7] Reset button
[8] Display
[9] Boiler water pressure gauge
[10] DHW thermostat
[12] Condensate drain hose
[14] Cold water pipe
[16] DHW pipe
[17] Supply pipe
[18] Boiler high limit dial
4.2 Switching the appliance ON/OFF

Startup

▶ Switch the appliance ON using the ON/OFF switch.
The display shows the supply temperature.

Fig. 4

If the display shows in alternation with the supply temperature, the appliance operates at its lowest output for 15 minutes per the initial startup sequence.

Shutdown

▶ Switch the appliance OFF using the ON/OFF switch.
The display goes out.
▶ If the appliance is taken out of service for a longer period: observe frost protection (Section 4.7).

4.3 Turning the space heating ON

The maximum supply temperature can be set from 95 °F (35 °C) up to approx. 194 °F (90 °C). The current supply temperature is shown on the display.

With radiant floor heating, limit the maximum permissible supply temperature.
Adjusting the supply temperature with the boiler high limit dial III:
- Radiant floor heating: e.g. setting 3 (approx. 122 °F (50 °C))
- Panel or cast iron radiator heating: setting 6 (approx. 167 °F (75 °C))
- Heating with supply temperatures up to 194 °F (90 °C): setting max

The burner ON indicator lamp lights up if the burner is operating.

<table>

*Table 3  Typical supply temperatures*
4.4 Programming the heating control unit

Observe the operating instructions for the heating control unit included in the scope of delivery. There you can read:

▶ How to set the operating mode
▶ How to adjust the room temperature
▶ How to heat economically and save energy

4.5 Setting the DHW temperature

▶ Set the DHW temperature on the DHW thermostat. The set DHW temperature flashes on the display for 30 seconds.

![Diagram of DHW thermostat](image)

*Fig. 6*

<table>
<thead>
<tr>

</tr>
<tr>
<td>max</td>
<td>approx. 140 °F (60 °C)</td>
</tr>
</tbody>
</table>

*Table 4*
**ECO button**

Pressing and holding the ECO button until it lights up switches between **Comfort mode** and **Economy mode**.

- **Comfort mode (default setting)**
  The appliance is continually maintained at the set temperature. Consequently, DHW draws are immediate, however the appliance may run even if no DHW is being drawn.

- **Economy mode, ECO button lights up**
  - DHW is only generated when DHW is drawn.
  - **On demand:** Quickly open and close a DHW tap to signal the appliance to heat to the selected temperature. After a short wait DHW will be available.

---

The DHW on demand signal allows maximum gas and water savings.

### 4.6 Setting manual summer mode

In summer mode or warm weather shut down (WWSD), the heating zone pump and consequently central heating are switched off. DHW generation remains active following the DHW program.

---

**NOTICE:**

**Material damage due to frost!**

Heating system at risk of freezing. In manual summer mode, only the appliance is protected from freezing.

- Observe frost protection measures where there is a risk of freezing.

- Make a note of the setting of the boiler high limit dial.
Turn the boiler high limit dial \(\text{III}\) counterclockwise to \(\text{❄️}\). Figure 7

For further information, see the operating instructions for the heating control unit included in the scope of delivery.

4.7 Setting frost protection

Frost protection of the heating system:

- Leave the appliance switched ON; turn the boiler high limit dial \(\text{III}\) at least to position 1. Figure 8

For further information, see the operating instructions for the heating control unit included in the scope of delivery.
Alternatively if you prefer switching the appliance OFF:
▶ Ask a trained and certified heating contractor to mix anti-freeze (see installation
instructions) into the heating water. All DHW pipes and DHW tank must be
completely drained.

### 4.8 Activating the key pad lock

The key pad lock affects the supply temperature dial, the DHW thermostat, the
service button and the ECO button.

Activating the key pad lock:
▶ Press the key pad lock button until \[ \square \] and the heating supply temperature are
alternating on the display.

![Diagram of key pad lock activation](image)

**Fig. 9**

Unlocking the key pad:
▶ Press the key pad lock button until the display shows only the supply
temperature.

Table 5

5 Energy saving tips

Heating economically

The boiler is designed to provide a high level of comfort while keeping gas consumption and the resulting environmental impact as low as possible. The gas supply to the burner is controlled according to the heat demand. The boiler continues to operate on low fire if the demand for heat drops. The technical term for this process is modulating control, and it reduces temperature fluctuations and provides even distribution of heat throughout the home. This means that the boiler may stay on for relatively long periods but will use less gas than an appliance that continually cycles on and off.
Inspection/Maintenance

To ensure that gas consumption and environmental impact (pollution, etc.) remain as low as possible over an extended period of time, we recommend that you sign an inspection/maintenance contract with a trained and certified heating contractor covering scheduled annual service and maintenance.

Heating control unit

Use a heating control unit with room temperature influence or an outdoor reset control unit and thermostatic valves.

For further information, see the operating instructions for the heating control unit included in the scope of delivery.

Thermostatic valves

Fully open the thermostatic valves to ensure that the desired room temperature is reached in all cases. Allow several days for the system to stabilize after every adjustment and only change the setting for the heating curve or the room temperature on the control unit after the system had stabilized on the previous settings.

Radiant floor heating

Do not set the supply temperature higher than the maximum level recommended by the manufacturer.

Room venting

Do not keep windows cracked for ventilation purposes as it continuously cools down the room without significantly improving the air quality in the room. It is better to vent fully for a short time (with completely open windows).

Turn off the thermostats (if installed) in the room when venting.

Domestic hot water (DHW)

Always set the DHW temperature as low as possible.
A lower setting on the thermostat means a higher rate of energy savings.
Furthermore, higher DHW temperatures result in increased limescale deposits and thereby may impair the function of the appliance (e.g. longer heating-up times or lower output).
Recirculation pump

If there is a DHW recirculation pump installed, use a timer program to control its operation according to the specific requirements (e.g. morning, afternoon, evening).

6 Troubleshooting

The Heatronic boiler control monitors all safety and control components.

If a fault arises during operation, an audible warning tone sounds.

**NOTICE:**

**Risk of system damage from freezing!**

The heating system can freeze up in cold weather if it has been disabled by a fault shutdown.

- Rectify the fault immediately and restart the heating system.
- If this is not possible, protect your heating system from freezing by draining the heating system and hot water pipes at the lowest point.

Press a button to mute the warning sound.

The display indicates a fault code (e.g. 🛋) and the reset button may also be flashing.

If the **reset** button is flashing:

- Press the **reset** button and hold it until 🛋 appears on the display.
  The appliance starts up again and the current supply temperature is displayed.

If the **reset** button is not flashing:

- Switch the appliance OFF and ON again.
  The appliance starts up again and the current supply temperature is displayed.

If the fault persists:

- Contact a trained and certified heating contractor for assistance, providing details of the fault code and the appliance type and serial number.
An overview of the display codes can be found on page 22.

**Appliance details**

If you need to call a trained and certified heating contractor, you may be asked for details on your appliance. Those details can be found on the rating plate.

7 Maintenance

Inspection and maintenance
The operator is responsible for the safety and environmental compatibility of the heating system (see local regulations).
It is therefore recommended to sign a maintenance and inspection contract with a trained and certified heating contractor that provides annual inspection and maintenance. This ensures high efficiency and environmentally compatible combustion.

Cleaning the outside of the boiler and the control unit
Wipe down with a damp cloth. Do not use any abrasive or corrosive cleaning agents.

8 Environmental protection and disposal
Environmental protection is one of the fundamental company policies of the Bosch Group.
Quality of products, efficiency and environmental protection are equally important objectives for us. Environmental protection laws and regulations are strictly adhered to.
To protect the environment, we use the best possible technology and materials taking into account economic points of view.

Packaging method
For the packaging, we participate in the country-specific recycling systems, which guarantee optimal recycling.
All packaging materials used are environmentally-friendly and recyclable.

Old appliances
Old appliances contain valuable materials that can be recycled.
The components are easy to separate. Plastics are identified. This allows the various assemblies to be sorted and recycled or disposed of.
9 Quick reference

Startup

![Startup diagram]

DHW temperature

**WARNING:**

**Danger of scalding!**

- In normal operation, it is recommended to limit the DHW temperature to 122 °F (50 °C) to limit the risk of scalding.

Turning space heating ON

![Turning space heating ON diagram]

Heating control

Set the maximum supply temperature on the appliance. Set room thermostat to the desired temperature.
