CAUTION!
Before putting the boiler into operation read this manual carefully.

DANGER!
Improper installation, adjustment, alteration, service or maintenance can cause injury, loss of life or property damage. Refer to this manual. For assistance or additional information consult a qualified installer, service agency or the gas supplier.

CAUTION!
The operating manual is part of the documentation that is delivered to the installation’s operator. Go through the information in this manual with the owner/operator and make sure that he or she is familiar with all the necessary operating instructions.

Danger: If the information in these instructions is not followed exactly, a fire or explosion may result causing property damage, personal injury or loss of life.
• Do not store or use gasoline or other flammable vapors and liquids in the vicinity of this or any other appliance.
• What to do if you smell gas
  – Do not try to light any boiler.
  – Do not touch any electrical switch; do not use any phone in your building.
  – Immediately call your gas supplier from a neighbor’s phone. Follow the gas supplier’s instructions.
  – If you cannot reach your gas supplier, call the fire department.
• Installation and service must be performed by a qualified installer, service agency or the gas supplier.

Notice!
• This manual is available in the English and French language.
• This manual must be retained for future reference.

1 Explanation of symbols and safety information

1.1 Guideline to symbols

Warnings

![WARNING] A fire or explosion may result causing
property damage, personal injury or
death.
⇒ If the information in these instructions
is not followed exactly,

![DANGER] if flammable gas explodes.
⇒ Beware if you smell gas: there may be
an explosion hazard!

⇒ Do not store or use gasoline or other flammable
vapors and liquids in the vicinity of this or any other
boiler.

![WARNING] Dangerous flue gas can escape if the air
supply is insufficient.
⇒ Make sure that air vents are not
reduced in size or obstructed.
⇒ The boiler may only be operated after
the defect has been remedied.
⇒ Warn the user of the system of the
defect verbally and in writing.

![WARNING] Danger of fatal accident from explosive
fumes.
⇒ Only carry out work on gas pipes and
fittings if you are properly registered.

General warnings

The following instructions must be observed
• The boiler must only be used for its designated
purpose, observing the Installation Instructions.
• Only use the boiler in the combinations and with the
accessories and spares listed.
• Maintenance and repairs must only be carried out
by trained professionals.
• You are only permitted to operate the condensing
gas boiler with the combustion air/flue gas system
that has been specifically designed and approved
for this type of boiler.
• Please note that local approval of the flue system
and the condensate connection to the public sewer
system may be required.

Signal words at the beginning of a warning are used to indicate the type
and seriousness of the ensuing risk if measures for minimizing damage
are not taken.
• NOTE indicates that damage to property may occur.
• CAUTION indicates possible minor to medium personal injury.
• WARNING indicates possible severe personal injury.
• DANGER indicates a potential for loss of life.

Important Information

Important information neither indicating personal injury
nor damage to property are marked with this symbol.
They are separated by lines above and below the text.

Additional symbols

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Explanation</th>

Table 1
What to do if you smell gas:

- Do not try to light any boiler.
- Do not touch any electrical switch; do not use any phone in your building.
- Immediately call your gas supplier from a neighbor’s phone.
- Follow the gas supplier’s instructions.
- If you cannot reach your gas supplier, call the fire department.

If boiler installation is provided as replacement heater, **do not** connect new boiler venting to an existing vent system, if it is shared with other appliances.

- The local building regulations stipulating the installation rules at the time of installation.
- The local building regulations concerning the air intake and outlet systems and the chimney connection.
- The regulations for the power supply connection.
- The technical rules laid down by the gas utility company concerning the connection of the gas burner fitting to the local gas main.
- The instructions and standards concerning the safety equipment for the water/ space heating system.
- The Installation Instructions for building heating systems.
- The boiler must be located in an area where leakage of the tank or connections will not result in damage to the area adjacent to the boiler or to lower floors of the structure. When such locations cannot be avoided, it is recommended that a suitable drain pan, adequately drained, be installed under the boiler. The pan must not restrict combustion air flow.
- The boiler must be installed such that the gas ignition system components are protected from water (dripping, spraying, rain etc.) during boiler operation and service.
- Do not restrict or seal any air intake or outlet openings.
- If you find any defects, you must inform the owner of the system of the defect and the associated hazard in writing.
- The boiler must not be installed on carpeting.

Operating Limits of the boiler:

- Max. boiler temperature: 230 °F (110 °C)
- Max. operating pressure: 30 psi (2.6 bar)
- With optional pressure relief valve: 50 psi (3.45 bar).

The hot water distribution system must comply with applicable codes and regulations. When replacing an existing boiler, it is important to check the condition of the entire hot water distribution system to ensure safe operation.

**2.1 Massachusetts Installations Only**

(a) For all side wall side horizontally vented gas fuelled equipment installed in every dwelling, building or structure used in whole or in part for residential purposes, including those owned or operated by the Commonwealth and where the side wall exhaust vent termination is less than 7 feet above finished grade in the area of the venting, including but not limited to decks and porches, the following requirements shall be satisfied:

1. INSTALLATION OF CARBON MONOXIDE DETECTORS. At the time of installation of the side wall horizontally vented gas fueled equipment, the installing plumber or gas fitter shall observe that a hard wired carbon monoxide detector with an alarm and battery back-up is installed on the floor level where the gas equipment is to be installed. In addition, the installing plumber or gas fitter shall observe that a battery operated or hard wired carbon monoxide detector with an alarm is installed on each additional level of the dwelling, building or structure served by the side wall horizontal vented gas fueled equipment. It shall be the responsibility of the property owner to secure the services of qualified licensed professionals for the installation of hard wired carbon monoxide detectors
   - In the event that the side wall horizontally vented gas fueled equipment is installed in a crawl space or an attic, the hard wired carbon monoxide detector with alarm and battery back-up may be installed on the next adjacent floor level.
   - In the event that the requirements of this subdivision can not be met at the time of completion of installation, the owner shall have a period of thirty (30) days to comply with the above requirements; provided, however, that during said 30 day period, a battery operated carbon monoxide detector with an alarm shall be installed. Alarm and battery back-up may be installed on the next adjacent floor level.

2. APPROVED CARBON MONOXIDE DETECTORS. Each carbon monoxide detector as required in accordance with the above provisions shall comply with NPA 720 and be ANSI/UL 2034 listed and IAS certified.

3. SIGNAGE. A metal or plastic identification plate shall be permanently mounted to the exterior of the building at a minimum height of 8 ft. above grade directly in line with the exhaust vent terminal for the horizontally vented gas fuelled heating appliance or equipment. The sign shall read, in print size no less than 1.5 in size, GAS VENT DIRECTLY BELOW: "KEEP CLEAR OF ALL OBSTRUCTIONS".

**Regulations and guidelines**

- The installation must conform to the requirements of the authority having jurisdiction or, in the absence of such requirements, to the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CAN/CSA B149.1, Natural Gas and Propane Installation Code.
- Where required by the authority having jurisdiction, the installation must conform to the Standard for Controls and Safety Devices for Automatically Fired Boilers, ANSI/ASME CSD-1.
- Install CO detectors per local regulations. Boiler requires yearly maintenance → chap. 12 "Maintenance", page 41.
4. INSPECTION. The state or local gas inspector of the side wall horizontally vented gas fuelled equipment shall not approve the installation unless, upon inspections, the inspector observes carbon monoxide detectors and signage installed in accordance with the provisions of 248 CRM 5.08(2)(a)1 through 4.

(b) EXEMPTIONS: The following equipment is exempt from 248 CRM 5.08(2)(a)1 through 4:

The following equipment is exempt from 248 CRM 5.08(2)(a)1 through 4:
1. The equipment listed in Chapter 10 entitled “Equipment Not Required To Be Vented” in the most correct edition of NFPA 54 as adopted by the board; and
2. Product Approved side wall horizontally vented gas fueled equipment installed in a room or structure separate from the dwelling, building or structure used in whole or in part for residential purposes.

(c) MANUFACTURERS REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM REQUIRED.

When the manufacturer of Product Approved side wall horizontally mounted gas equipment provides a venting system design or venting system components with the equipment, the instructions provided by the manufacturer for the installation of the equipment and venting shall include:
1. Detailed instructions for the installation of the venting system or the venting system components; and
2. A complete parts list for the venting system design or venting system.

(d) MANUFACTURERS REQUIREMENTS - GAS EQUIPMENT VENTING SYSTEM NOT PROVIDED.

When the manufacturer of Product Approved side wall horizontally vented gas fueled equipment does not provide the parts for the venting of flue gases, but identifies “special venting systems”, the following requirements shall be satisfied by the manufacturer:
1. The referenced “special venting systems” shall be included with the appliance or equipment installation instructions; and
2. The “special venting systems” shall be Product Approved by the Board, and the instructions for that system shall include a parts list and detailed installation instructions.

(e) A copy of all instructions.

For all Product Approved side wall horizontally vented gas fueled equipment, all venting instructions, all parts lists for venting instructions, and/or venting design instructions shall remain with the appliance or equipment at the completion of the installation.

3 General information

About these instructions

These Installation Instructions contain important information for the safe and professional installation, start-up and maintenance of the boiler with boiler input rating of 80 kW and 100 kW.

These Installation Instructions are intended for professional installers, who have the necessary training and experience for working on heating and gas systems.

Cascade installation

Special cascade units (accessories) have been developed to enable this boiler to be installed in a cascade system. Every cascade unit includes an installation frame, horizontal headers, connection pipes for the boiler, main gas pipe and a vertical low loss header. Cascade units are available for installing the boilers inline or back-to-back. These cascade units make installing a cascade system easier and less labor intensive.

Please contact Buderus for further information about cascade systems.

Updating of documentation

The following technical documentation is available for the Logamax plus GB162-L.B. 80 kW/100 kW:

- Installation instructions,
- User’s manual,
- Service manual.

Subject to technical modifications

Slight changes may be made without prior notice to the illustrations, process steps and technical data as a result of our policy of continuous improvement.

<table>
<thead>
<tr>

</tr>
<tr>
<td>100 kW</td>
<td>333,000 btu/hr</td>
<td>315,000 btu/hr</td>
</tr>
</tbody>
</table>

Table 2 max. input rate

3.1 Designated use

The boiler was designed to heat water in a central heating system and generating domestic hot water. It is suitable for connection to fully pumped, sealed water systems only, with a maximum supply temperature set point off 180°F (82°C).

The boiler can be installed either as a single system or as part of a multiple system (cascade system).

This boiler may not be installed in places below 4,001 ft.

3.2 Heating system water quality

The quality of the system water is very important. Poor water quality can damage heating systems due to scale formation and corrosion.

For further details, please see the accompanying “Water quality requirements for Logamax plus GB162-L.B. 80kW/100 kW” manual.

CAUTION:
Risk of system damage due to unsuitable heating system water.

- If oxygen-permeable pipes are used, e.g. for under floor heating systems, the systems must be separated from one another by plate heat exchangers. Unsuitable heating system water promotes sludge and corrosion formation. This can result in heat exchanger malfunction and damage.

3.3 Pump test

If the boiler has not been operational for approx. 2 days, the pump will automatically run for 10 seconds every 24 hours. This pump test is first carried out 24 hours after the main power has been connected to the boiler.

3.4 Freeze protection

The boiler has integrated freeze protection that switches the boiler ON at a space heating (CH) water temperature of 45 °F (7 °C) and switches it OFF at a CH flow temperature of 59°F (15°C).

This feature does not protect the central heating system from freezing. If there is a risk of radiators or pipe sections freezing up, we recommend setting the pump run-over time to 24 hours (⇒ § 13.4. page 46)

3.5 Tools, materials and further equipment

For the installation and maintenance of the boiler you will need the standard tools for space heating, gas and water fitting. In addition, a hand truck with a fastening belt is useful.

3.6 Disposal

- Dispose of the boiler packaging in an environmentally sound manner.
- Dispose of components of the heating system (e.g. boiler or control device), that must be replaced in an environmentally responsible manner.
4 Dimensions and connections

4.1 Without pump group

The required permanent clearances (closely) are:
in front: 1" (25 mm)
right side: 0
left side: 0
above: 6" (152 mm).

The position selected for installation MUST allow adequate space for servicing in front of the boiler of at least 16.5" + 20.5" + 37" (940 mm). Maintain an installation clearance from combustible construction from hot water piping of at least 1" (25 mm).
4.2 With pump group

The required permanent clearances (closet) are:
- in front: 1" (25 mm)
- right side: 0
- left side: 0
- above: 6" (152 mm).

The position selected for installation MUST allow adequate space for servicing in front of the boiler of at least 16.5" + 20.5" = 37" (940 mm). Maintain an installation clearance from combustible construction from hot water piping of at least 1" (25 mm).

[E] (GAS) = Gas connection to boiler; Rp1" female thread
[F] (RK) = Return; G1½" union nut with female thread
[G] (AKO) = Condensate outlet; Ø 32 mm (1¼")O/D
[H] (PF) = Pump group supply; G1½" male thread, flat seal
[I] = Gas connection to pump group; 1" NPT female thread
[J] (PR) = Pump group return; G1½" male thread, flat seal
5 Packaging and transportation

5.1 Scope of delivery
The boiler is delivered factory-assembled.

► When receiving the delivery, check if the packaging is intact.
► Check that all items are included in the delivery.

Additional required accessories (not in delivery content)
A single boiler must be installed with the Buderus low loss header (LLH) to regulate the flow. The low loss header must be ordered separately. The low loss header delivery comes also with the AM10 modulating outdoor reset control.

Multiple boiler cascade installations can use the Buderus cascade frame accessories. Please contact Buderus for further informations.

► When receiving the delivery, check if the packaging is intact.
► Check that all items are included in the delivery (→ fig. 5).

Fig. 5 Additional accessories

[1] Low loss header (single installation only)
[2] AM10 modulating outdoor reset control

5.2 Transporting the boiler

CAUTION: The boiler may be damaged when it is improperly secured.

► Only transport the boiler using the right transportation equipment, such as a hand truck with a fastening belt or special equipment for maneuvering steps.
► During transportation the boiler must be secured on the transportation equipment to prevent it from falling off.
► Protect all parts against impacts if they are to be transported.
► Observe the transportation markings on the packaging.

CAUTION: The unpacked boiler may be damaged when not protected against contamination.

► Leave the protective covers on the connections.
► Cover the flue gas connections at the top of the boiler with plastic film.

► Always lift and carry the boiler with 2 people as shown in fig. 6, or use a hand truck or special equipment.

Fig. 6 Lift and carry the boiler correctly

0 1 2 3 4 5 6 7 8 9

7746800163-01.1TD

CAUTION: Damage to the unit by lifting or carrying incorrectly.

► Do not hold the boiler by the door covering the control panel (→ fig. 7).
6 Installation

6.1 Requirements for the installation room

DANGER:
- Install the heating system in a frost-free room.
- If the boiler is operated dependent on room air, the installation room must have the required air vents. Do not obstruct these vents. The air vents must always be free.
- When installed in a room with thin walls or a thin floor, resonating noise may occur. Install noise reducing parts if required.
- Do not store any flammable materials or liquids in the immediate vicinity of the boiler.
- Never use any chlorinated detergents or halogenated hydrocarbons (e.g. in spray cans, solvents and detergents, paints, adhesives).
- Do not allow too much dust to collect on the boiler.

6.2 Requirements for the heating system
- Installing a dirt trap like a y-strainer and a desludging device is required. This must be installed in the heating system in the immediate vicinity of the boiler, in an easily accessible position between the boiler and the lowest point in the return of the system.
- Clean the dirt trap at every annual service.
- Never use salt bedding type exchangers (ion exchangers) to soften the water.
- The low loss header and boiler connection set must be installed (supplied with the boiler).
- When using oxygen-permeable pipes (plastic), e.g. for floor heating systems, you must separate the system using secondary heat exchangers.

6.3 Installing the boiler
Observe the installation distances of the combustion air/flue gas system.
- Before starting installation check that the carrying capacity of the wall is sufficient for the boiler weight.

NOTICE
- To protect the connection orifice you must not remove the styrofoam bottom panel.
- Do not lift the boiler by the door covering the control panel (chap. 5.2 “Transporting the boiler”, page 10).
- Protect the boiler and the combustion air/flue gas orifice against pollution during installation.

Remove the packaging and dispose of it in an environmentally manner.
- Measure the installation height (chap. 4 “Dimensions and connections”, page 8).
- Mark both holes with the wall bracket (fig. 8) using a spirit level.
- Install the wall bracket with 2 screws (fig. 8).

With 2 people, lift the boiler by holding it by its back and by the transport rail at its bottom and install it on the wall bracket (fig. 6, page 10).
- The boiler can be moved sideways to get the correct position.
- Level the boiler with the set screw and a spirit level (fig. 9).

Fig. 7 Incorrect way of lifting and carrying the boiler

Fig. 8 Installing the wall bracket

Fig. 9 Aligning the boiler with the set screw
6. Installation

▶ Remove the protective covers from the bottom of the boiler (  fig. 10).

6.4 Water and Gas connection

6.4.1 General

The water and gas connections to the boiler are made using the pump group (  fig. 4, page 10). This pump group includes the circulation pump and a pressure relief valve.

Fig. 11 Pump group

[1] pressure relief valve
[2] supply water valve
[4] circulation pump
[5] gas inlet
[6] return water valve
[7] pump group cover

NOTICE
▶ Some residual water from final testing may leak away.

6.4.2 Connecting the pressure relief valve (PRV)

The pressure relief valve is a part of the supplied pump group (  fig. 11, [1]). A listed ASME pressure relief valve supplied with the boiler must be installed at the time of installation. No valve is to be placed between the PRV and the boiler.

No reducing coupling or other restriction may be installed in the discharge line. The discharge line must be within 12" (305 mm) with a minimum of 4" (100 mm) above a drain and installed such that it allows complete drainage of both the PRV and the line. The location of the PRV must be readily accessible for servicing or replacement and be mounted as close to the boiler as possible. To install the PRV, a suitable fitting connected to an extension on a “T” fitting can be sweated to the hot water line. Support all piping.

Maintain an installation clearance from combustible construction of at least 1" (25 mm) from the hot water piping.

6.4.3 Making the gas connection

NOTICE
▶ Avoid installing the boiler above radiation levels. If the boiler is installed above radiation sections, a low water cutoff shall be installed and wired to the boiler. Follow local code or in case of use of a low water cutoff, be aware to use an air vent, in order to prevent the boiler from shutting down unnecessarily.

DANGER:
▶ Only carry out work on gas lines if you are a qualified gas fitter

▶ The manual gas shutoff valve is part of the pump group, and is installed in accordance with the pump group installation instructions.

Fig. 12 Low loss header

NOTICE
▶ If you do not use the included pump group, you have to install a separate circulation pump under the boiler. This pump must be selected so that the volume flow through the boiler is sufficient to handle the maximum boiler input rating (  § 6.4.5, page 13).

▶ Install the pump group on the boiler in accordance with the pump group installation instructions.

A single boiler must be installed with the low loss header to regulate the flow.

▶ Install the low loss header [1].
- Determine proper size gas pipe for the installation using table 4 and table 5. Do not forget the pipe fitting losses and observe proper size of the fittings.
- Connect the gas supply pipe to the manual gas shutoff valve, so that it is free from any strain.

### 6.4.4 Installing the heating supply and return pipe

#### Fig. 13 Connecting the boiler supply and return

#### 6.4.5 Installing the pump

Always use the supplied Buderus pump group and the low loss header when installing a single boiler so correct flows are guaranteed. It is not necessary to install a low loss header for cascade systems.

- **Install the pump (→ fig. 13, [8]) in the return circuit (→ fig. 13, [2]).**

#### 6.4.6 Installing the condensate trap

**WARNING:**
Danger of fatal accident due to poisoning
- **If the condensate trap is not filled with water, flue gas can escape and put people’s lives at risk.**

- **Fill the condensate trap (supplied with the boiler) with water (→ fig. 14).**
Installation

▶ Connect the condensate trap [1] to the condensate outlet. The condensate trap has a bayonet connector, insert and turn ¼ rotation clockwise to click into position.

Fig. 15 Installing the condensate trap

▶ Connect the condensate trap hose [3] and the rubber sleeve [2] to the condensate trap [1].

Fig. 16 Installing the condensate trap hose

6.5 Connecting the condensate drain pipe

NOTICE ▶ The condensate must be drained from the boiler in accordance with local, state or federal rules and regulations.

NOTICE ▶ Use materials approved by the authority having jurisdiction. In the absence of such authority, PVC and CPVC pipe must comply with ASTM D1785, F441 or D2665. Cement and primer must comply with ASTM D2564 or F493. For Canada, use ULC certified PVC or CPVC pipe, fittings and cement.

NOTICE ▶ Install the condensate drain pipe taking the following into account:
- An air gap of at least 1" (25.4 mm) must be maintained between the boiler condensate trap hose and the condensate pipe work (→ fig. 17 and fig. 18).
- If the condensate outlet of the boiler is lower than the drain, a condensate pump must be used.
- The condensate produced by the boiler has a pH value between 3 and 4.
▶ Install a neutralization unit if required by the local code.

6.5.1 Connecting the expansion vessel in a single-boiler system

CAUTION: Damage to the installation due to faulty pressure relief valve.
▶ The expansion vessel must be of sufficient capacity.
Connect the expansion tank to the boiler return. If a check valve is available: connect the expansion vessel to the CH-side of the check valve in the return circuit [1].

**Fig. 19 Connecting the expansion vessel in a single-boiler system**

[1] Expansion vessel
[2] Gas supply
[3] Air gap < 1" (25.4 mm)

**Low Water Cut-Off (LWCO) and External Manual Reset High Limit**

A hot water boiler installed above radiation level or as required by the Authority having jurisdiction, must be provided with an external Low Water Cut-Off (LWCO) and/or an External Manual Reset High Limit device, either as a part of the boiler or at the time of boiler installation.

- Contractor to furnish and install LWCO and Manual Reset High Limit devices as required by local codes.
- Do not install any type of value or check valve in between boiler and LWCO or Manual Reset High Limit.
- Refer to the manufacturer’s instructions when installing LWCO and Manual Reset High Limit.
- LWCO is installed external to the boiler and must be located above the highest point of the boiler heat exchanger.
- Manual Reset High Limit remote sensing bulb must be located in the boiler supply.
- In a cascade each boiler must be equipped with its own LWCO and Manual Reset High Limit.

- Remove the 1" plug and connect a 1" Tee at the back of the boiler manifold.
- Connect a 1" well for the Manual Rest High Limit probe [3] at the horizontal end.
- Remove the 1" NPT plug to connect the LWCO stand pipe [1].
- Install a 1" stand pipe that reaches above the highest point of the boiler heat exchanger at the vertical connector of the Tee.
- Wire the LWCO [NC1] and the Manual Reset High Limit [NC2] normally closed dry contacts in series with EV pins 1 and 2 on the boiler, which will shut off the burner when the connection is interrupted.

**Fig. 20 Low Water Cut-Off views**

(Note: Power supply to LWCO and external high limit not shown for clarity.)

[1] Automatic air vent
[2] Low Water Cut-Off

**6.6 Combustion Air and Ventilation Openings**

Provisions for combustion and ventilation air must be made in accordance with section 5.3, Air for Combustion and Ventilation, of the National Flue Gas Code, ANSI Z223.1/NFPA 54, or Sections 7.2, 7.3 or 7.4 of CAN/CGA B149, Installation Codes, or applicable provisions of the local building codes.

**DANGER:**

Fire danger due to flammable materials or liquids.
- Do not store flammable materials and liquids in the immediate vicinity of the boiler.

**WARNING:**

Boiler Damage.
- Boiler must be clear and free from combustible materials, gasoline and other flammable vapors and liquids, and corrosive liquids and vapors.
- Never use chlorine and hydrocarbon containing chemicals (such as spray chemicals, solution and cleaning agents, paints, glues etc.) in the vicinity of the boiler.
- Do not store and use these chemicals in the boiler room.
- Avoid excessive dust formation and build-up.
Installation

CAUTION:
Boiler damage and operational failures! Due to insufficient or improper openings for combustion air and/or ventilation of the boiler room. Provisions for combustion air and ventilation are always required, regardless whether the combustion air is taken from the outside (sealed combustion) or inside (room air for combustion). Insufficient ventilation of the boiler room can lead to high air temperatures. This can result in boiler damage.
- Make sure that intake and exhaust openings are sufficiently sized and no reduction or closure of openings takes place.
- When the problem is not resolved, do not operate the boiler.
- Please note these restrictions and its dangers to the operator of the boiler.

NOTICE
- When one expects contaminated combustion air (near swimming pools, chemical cleaning operations and hair salons), sealed combustion operation is recommended.

All Air from inside the Building (non sealed combustion)
The closet shall be provided with 2 permanent openings communicating directly with an additional room(s). The total input of all gas utilization equipment installed in the combined space shall be considered in making this determination. Each opening shall have a minimum free area of $1^2$ per 1,000 Btu/hr of total input rating of all gas utilization equipment in the confined space, but no less than $1.002^2$. One opening shall commence within 12" (305 mm) of the top, and one opening shall commence within 12" (305 mm) of the bottom of the enclosure. The minimum dimension of air openings shall be not less than 4" (101.6 mm).

1. Where directly communicating with the outdoors, each opening shall have a minimum free area of $1^2$ per 4,000 Btu/hr of total input rating of all equipment in the enclosure.
2. Where communicating with the outdoors through vertical ducts, each opening shall have a minimum free area of $1^2$ per 4,000 Btu/hr of total input rating of all equipment in the enclosure.
3. Where communicating with the outdoors through horizontal ducts, each opening shall have a minimum free area of $1^2$ per 2,000 Btu/hr of total input rating of all equipment in the enclosure.
4. Where ducts are used, they shall be of the same cross-sectional area as the free area of the opening to which they connect.

All Air from Outdoor (sealed combustion)
The closet shall be provided with 2 permanent openings communicating directly with an additional room(s). The total input of all gas utilization equipment installed in the combined space shall be considered in making this determination. Each opening shall have a minimum free area of $1^2$ per 1,000 Btu/hr of total input rating of all gas utilization equipment in the confined space, but no less than $1.002^2$. One opening shall commence within 12" (305 mm) of the top, and one opening shall commence within 12" (305 mm) of the bottom of the enclosure. The minimum dimension of air openings shall be not less than 4" (101.6 mm).

6.7 Flue gas adapter

CAUTION:
- Do not use lubricants to avoid degradation of the lip rings.

- When installing PVC vent pipes remove the upper lip ring and insert [1].
- In case of open venting, use basket [2] on the air intake.
- When installing parallel PP venting material remove upper lip ring and insert [1] and use PVC/PP PolyPro adapter offered by your local vent supplier.

Fig. 21  Connecting the flue gas adapter (parallel)
- When installing concentric PP venting material remove upper lip ring and insert (➔ fig. 21, [1]) and place air intake cap [1].

Fig. 22  Placing air intake cap

6.8 Installation of the Exhaust and Air Intake system

NOTICE
- Consult local and state codes pertaining to special building code and fire department requirements. Adhere to national code requirements.
- Observe the listed maximum lengths of vent system, which are boiler model dependent. The maximum permissible lengths are listed in table 8, page 21.
Optional vent kits are:
1. Parallel or concentric, horizontal (with approved wall terminal) or vertical.

Fig. 23 Vent pipes

The termination shall be at least 4 ft. (1,220 mm) for the U.S. and 6 ft. (1,830 mm) for Canada away from a gas utility meter, service regulator or the like (for room air applications only).

The termination shall terminate at least 4 ft. (1,220 mm) below, 4 ft. (1,220 mm) horizontally from, or 1 ft. (305 mm) above any door, window, or gravity air inlet into any building.

Vent must be at least 12" (305 mm) above grade, anticipated snow line or roof surface (Canada 18" (457 mm) minimum) (→ fig. 24). Vent termination must be at least 7 ft. (2,135 mm) above a public walkway (→ fig. 25).

Fig. 24 Vent and air pipe position (1) of a sealed combustion system

Vent must be 3 ft. (915 mm) above grade, anticipated snow line or roof surface (Canada 18" (457 mm) minimum) (→ fig. 24). Do not extend exposed vent pipe outside the building beyond recommended distance. Condensate could freeze and block vent pipe. Vent should terminate at least 3 ft. (915 mm) away from adjacent walls, inside corners and 5 ft. (1,525 mm) below roof overhang (→ fig. 25). It is not recommended to terminate vent above any door or window, condensate can freeze causing ice formations. Do not use chimney as a raceway if another boiler or fireplace is vented into or through chimney.

All PVC and CPVC vent pipes must be glued, except for the flue gas adapter. Installed you can slide the pipe onto the adapter, properly supported and the exhaust pipe must be pitched a minimum of a ¼" (6.35 mm) per foot back to the boiler. This allows the condensate to drain away.

All non-steel combustion air and vent pipe materials and fittings must comply with the following and must be UL approved venting material:

Installation

NOTICE

- Use of cellular core PVC (ASTM F891), cellular core CPVC, or Radel® (polyphenolsulfone) in venting systems shall be prohibited.
- Covering non-metallic vent pipe and fittings with thermal insulation shall be prohibited.
- A minimum clearance of 4 ft. (1,220 mm) horizontally from and in no case above and below, unless a 4 ft. (1,220 mm) horizontal distance is maintained, from electric meters, gas meters, regulators and relief equipment.

**Fig. 25 Vent and air pipe position (2) of a system with combustion air supply from the room (non-sealed)**

1. Height at least 1 ft (305 mm) above grade and snow line
2. Exhaust terminal must be at least 3 ft. (915 mm) above forced air inlet within 10 ft. (3,050 mm)
3. Forced Air Inlet
4. Gravity Air Inlet

Below are approved examples of vertical and horizontal venting installation

NOTICE

- Place pipe supports every 5 ft. (1,525 mm) of horizontal and vertical run, beginning with support near boiler.
- The condensate must be drained in accordance with the applicable rules (§ 6.5, page 14).
- Periodic cleaning of the vent terminal and air-intake screens is mandatory.
- Avoid locating vent terminals near equipment or construction which can be subject to degradation from exhaust gases.
**Fig. 26** Horizontal venting system (sealed combustion)

[3] 12” (300 mm) over max. snow level or 24” (600 mm) whichever is greater
[4] 10°-0° MIN (250 mm - 0 mm MIN)

Do not exceed the total equivalent venting length of 100 feet (30,480 mm) maximum requirement each for the intake and exhaust piping.
At the time of removal of an existing boiler, the following steps shall be followed with each appliance remaining connected to the common venting system placed in operation, while the other appliances remaining connected to the common venting system are not in operation:

a) Seal any unused openings in the common venting system.

b) Visually inspect the venting system for proper size and horizontal pitch and determine there is no restriction, leakage, corrosion and other deficiencies which could cause unsafe condition.

c) Place in operation the appliance being inspected. Follow the lighting instructions. Adjust thermostat so appliance will operate continuously.

d) Test for spillage at the draft hood relief opening after 5 minutes of burner operation. Use the flame of a match or candle, or smoke from a cigarette, cigar or pipe.

e) Any improper operation of the common venting system should be corrected so the installation conforms with the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CAN/CSA B149.1, Natural Gas and Propane Installation Code.

When resizing any portion of the common venting system, the common venting system should be resized to approach the minimum size as determined using the appropriate tables in Part 11 of the National Fuel Gas Code, ANSI Z223.1/NFPA 54 and/or CAN/CSA B149.1, Natural Gas and Propane Installation Code.

### 6.9 Multiple boiler vent terminal clearance

**Vertical terminations:**

The combustion air inlet pipe must terminate in a downward position using 2 × 90° elbows. The combustion air inlet pipe shall terminate at least 3 ft (914 mm), horizontally from the center line of the exhaust vent, this is to prevent cross contamination of flue gases into the combustion air stream.

Terminate all exhaust vents at the same height and all combustion air inlets at the same height, while maintaining the minimum 36" (914 mm) height clearance from the exhaust to the down turned 90° elbow and combustion air inlet.

Exhaust vent termination edge shall be at least 24" (610 mm) from the edge of the air inlet pipe of an adjacent heater. Exhaust vent terminations shall be placed at a minimum of 12" (305 mm) center to center (fig. 34 and fig. 35).

Air intake terminations may be placed adjacent to each other. The combustion air inlet is part of the direct vent system and not classified as a forced air inlet.
7 Electrical connections

7.1 External connection board connections

**WARNING:**
Danger of fatal accident due to electric shock.
- 120 VAC-connections may be present on the external connection board when power is supplied to the boiler.
- Open the boiler door.

**Devices such as pumps, outdoor sensor and 3-way valve are all connected to the external connection board.**

The electrical connections to the boiler must be made in accordance with all applicable local codes and the latest revision of the National Electrical Code, ANSI/NFPA-70.

If installed in Canada, electrical connections should conform with CSA C22.1 Code part 1.

**Fig. 34 Vertical terminations**

[1] minimum 12" (305 mm)
[2] minimum 36" (914 mm)
[3] minimum 36" (914 mm)
[4] minimum 12" (305 mm)
[5] minimum 36" (915 mm)
[6] minimum 24" (610 mm)

**Horizontal terminations:**
Combustion air inlet elbow must terminate at least 12" (305 mm) below exhaust elbow or outlet, but not exceed 15" (381 mm) maximum separation (Fig. 35).

Horizontal termination shall not extend beyond 18" from the building (based on minimum 12" (305 mm) required separation between intake and exhaust). Exhaust vent vertical rise shall not extend beyond 39" (991 mm) from building penetration to termination elbow (Fig. 35).
Condensate could freeze and block vent pipe.

Terminate all exhaust vents at the same height and all combustion air inlets at the same height, while maintaining the minimum 12" (305 mm) vertical height clearance from between exhaust and combustion air inlet. Exhaust vent termination edge shall be at least 12" (305 mm) laterally from the edge of the air inlet pipe of an adjacent heater.
The combustion air inlet is part of the direct vent system and not classified as a forced air inlet.

**Fig. 35 Horizontal terminations**

[1] minimum 12" (305 mm)
[2] maximum 15" (381 mm)
[3] maximum 18" (457 mm)
[4] minimum 12" (305 mm)
[5] maximum 12" (305 mm)
[6] maximum 39" (991 mm)
Remove the screw to release the cover over the electrical connections and pull the cover upwards (➔ fig. 36).

7.1.1 Routing the cable through the boiler

- Route the cable for the low-voltage connections through the opening on the left [1].
- Route the cable for the 120 VAC connections through the opening on the left [2].
- Route and attach the cable for the 120 VAC connections using the strain relief clamps [3].
- Only the 120 V electrical connections require a 14 gauge wire.

7.1.2 Low voltage connections

**WARNING:** due to electric shock.

- Make sure no power is supplied to the boiler when making connections

Fig. 36 Removing the cover

**NOTICE**

- The RC and WA terminals cannot be used simultaneously.

**RC Terminal - Room Controller**

- Connect a Room- or Cascade controller to the orange RC terminal (➔ fig. 38) (➔ § 7.1.4, page 24).

**FA Terminal - Outdoor temperature sensor**

If outdoor temperature-dependant control operation is used, an outdoor temperature sensor must be connected.

- Connect the outdoor temperature sensor to the blue FA terminal (➔ fig. 38).

**WA Terminal - Potential-free heat demand**

With this connection the room temperature-based modulating function of the boiler is not used. This has a negative effect on comfort and energy consumption. The boiler will now only modulate up to the preset space heating water temperature.

- Connect the potential-free heat demand contact (On/Off thermostat) or relay panel end switch to the green WA terminal (➔ fig. 38).
  
  The maximum allowed resistance of this circuit is 100 Ω.

**FW Terminal - DHW temperature sensor**

- Connect the external DHW temperature sensor to the grey FW terminal, using the harness enclosed with the DHW temperature sensor.
Electrical connections

**NOTICE**
- It is not possible to connect more than 1 DHW temperature sensor in the boiler.
- Connect a DHW temperature sensor suitable for this particular boiler.

**EV Terminal - External switching contact**
An external switch contact can be used, i.e. to safeguard a floor heating system so that the heating water temperature will not become too high etc.
When the external switch contact is opened, the boiler will be switched off for heating operation and for domestic hot water operation.
The pump continues to run for the run-over time set on the boiler.
- Remove the cable from the EV terminal (fig. 38).
- Connect the external switch contact to the red EV terminal (fig. 38).

**DWV Terminal - 3-way valve**
- Do not use this connection.

### 7.1.3 120 VAC connections

**NOTICE**
- Use the 120 VAC connections for specific hydraulic configurations and a corresponding controller.

![Fig. 39 120 VAC Connections](image)

1. PK
2. PS
3. PZ
4. 120 VAC

**PK Terminal - External pump**
- Connect the external heating or system pump (for situations where the pump of the Buderus pump group is not used) to the green PK terminal (fig. 39). The maximum allowed connected load of the pump = 100 Watts.

**PS Terminal - DHW pump**
- Connect the DHW pump to the grey PS terminal (fig. 39). The maximum allowed connected load of the pump = 100 Watts.

**PZ Terminal - DHW circulation pump**
- Connect the DHW circulation pump to the lilac PZ terminal (fig. 39). The maximum allowed connected load of the pump = 100 Watts.

**Mains connector**

**WARNING:**
Connecting incoming power
- Ground the boiler electrically in accordance with local codes, or in absence of local codes, with the National Electrical Code, ANSI/INFPA 70 and/or the CSA C22.1, Electrical Code.
- Install a 120 VAC cable to the boiler mains connection.

### 7.1.4 Controller

**NOTICE**
- It is not possible to connect more than 1 room controller.

The following controls can be connected to the boiler:
- Logamatic RC35 room controller,
- Logamatic 4323 controls,
- Control with contact for potential free heat demand
- Error reporting module EM10, 0 – 10 V input (can be used to convert a 0 – 10 V signal to a modulating signal),
- MCM boiler cascade module up to 16 boilers.

To install additional modules in the boiler, see § 7.2 "Installing function modules (accessories)", page 24.

**Installing an RC35 controller as an outdoor reset control in the boiler**
- Open the control panel cover.
- Remove the cover [1].
- Install the RC35 in the slot [2].

![Fig. 40 Installing the room controller](image)

### 7.2 Installing function modules (accessories)

**NOTICE**
- Refer to the installation instructions of the relevant function modules for information about installation and combination possibilities.

The following function modules (accessories) can be connected to the boiler:
- Heat demand 0-10 V module EM10,
- Error reporting module EM10,
- Switch module WM10,
- Mixing module MM10.

The function modules (accessories) can be installed in 2 ways:
- in the boiler (max. 2), see § 7.2.1.
- outside the boiler, see § 7.2.2.
7.2.1 Installing function modules in the boiler

▶ Loosen the screw (step 1).
▶ Pull open the drawer (step 2).

Fig. 41 Opening the drawer

▶ Install the wall bracket in the relevant slots in the drawer (➔ fig. 42).

Fig. 42 Installing the wall bracket

▶ Click the function module(s) into position in the wall bracket (➔ fig. 43).

Fig. 43 Clicking the function module into position

▶ Remove the drawer.
▶ Remove the covers of both free connectors on the function module connection cables (➔ fig. 44).

Fig. 44 Removing the covers

▶ Slide the drawer back into the boiler.
▶ Connect the free 120 VAC mains cable (➔ fig. 44) to the module [1]. If more modules are used, the 120 VAC supply for the second module can be taken from the first module using the cable enclosed with the module.

Fig. 45 Interconnecting modules

NOTICE
▶ The module may have the letters RC or EMS above the connection (➔ fig. 46, [1]).

▶ Connect the free connector of the EMS bus connecting cable (➔ fig. 45) to the first module (➔ fig. 46).
▶ If more modules are used, the EMS bus connection for the second module may be branched off from the first module using the cable enclosed with the module (➔ fig. 45 and fig. 46).
7.2.2 Installing function modules outside the boiler

- Install the module on the wall according to the installation instructions of the module.
- Make an EMS bus connection cable using a 2-core cable and the connector enclosed with the module (→ fig. 47).

**Important:** Use the connector of the same color as the connections on the module.

- Connect the EMS bus connection cable to the orange RC connection of the external connection board [1].

**NOTICE**
Pay attention to the polarity when using an EMS bus connection cable.
- Connect the wire from terminal 1 to terminal 1 and from terminal 2 to terminal 2 (→ fig. 45 and fig. 46).

**CAUTION:**
Wiring errors can cause improper and dangerous operation.
- Label all wires prior to disconnection when servicing.
- Verify proper operation after servicing.

7.3 Electrical wiring diagram

**CAUTION:**
Wiring errors can cause improper and dangerous operation.
- Connect the wire from terminal 1 to terminal 1 and from terminal 2 to terminal 2 (→ fig. 45 and fig. 46).

**Operation**

**8. Operation**

**8.1 BC10 basic controller**

The boiler is fitted with a control unit, the BC10 basic controller. This controller can be used to control the heating system.

- Push on the control panel (→ fig. 50) to get access to the BC10 basic controller (→ fig. 51).

---

**IMPORTANT**

The wires in this mains lead are colored in accordance with the following code:

**GREEN AND YELLOW - EARTH; BLUE - NEUTRAL; BROWN - LIVE**

As the colors of the wires in the mains lead of the appliance may not correspond with the colored markings identifying the terminals in your connector proceed as follows:

The wire colored green and yellow must be connected to the terminal on the connector marked with the letter E or by the earth symbol (Fig. 51) or colored green or green-and-yellow. The wire colored brown must be connected to the terminal marked with the letter L or colored red. The wire colored blue must be connected to the terminal marked with the letter N or colored black.

**WARNING**

THIS APPLIANCE MUST BE EARTHED

Ensure that your appliance is connected correctly - if you are in any doubt consult a qualified electrician.

For location of individual components, see service section and the exploded views in this manual.

---

**8O p e r a t i o n**

**8.1 BC10 basic controller**

The boiler is fitted with a control unit, the BC10 basic controller. This controller can be used to control the heating system.

- Push on the control panel (→ fig. 50) to get access to the BC10 basic controller (→ fig. 51).

---

**CAUTION:**

- Limit the space heating water temperature to the maximum flow temperature of the floor heating circuit.
- A power interruption discontinues manual operation. Frost damage may occur.

---

**“Chimney sweep” button (→ fig. 51, [3])**

The “Chimney sweep” button is used to put the boiler into flue gas test, service or manual operation mode. The BC10 maximum heating water temperature setting applies.

- The flue gas test enables the boiler to be run in full-load operation manually for a short period (→ table 12, page 29).
- The service mode enables the boiler to be run in part-load operation manually for a short period. Measurements and settings can be carried out on the boiler (→ table 13, page 29).
- The manual operation mode enables the boiler to be operated manually for a longer period. Use this mode when the control system has not been installed yet or is out of order (→ table 14, page 30).

**“Service” button (→ fig. 51, [4]):**

The “Service” button is used to display the current space heating water temperature, the current system pressure etc.

**Service Tool connection (→ fig. 51, [5]):**

For further information please contact Buderus.

**LED “Burner operation” (→ fig. 51, [6]):**

The LED “Burner operation” lights when the burner of the boiler is active and is extinguished when the burner is switched OFF.

The LED “Burner operation” indicates the burner status.

**Table 10 Meanings of LED “Burner operation” indications**

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>ON</td>
<td>Burner operational</td>
<td>Boiler water is being heated.</td>
</tr>
<tr>
<td>OFF</td>
<td>Burner off</td>
<td>The space heating water temperature has reached the target value and there is no heat demand.</td>
</tr>
</tbody>
</table>

**LED “Central heat demand” (→ fig. 51, [7]):**

The LED “Central heat demand” lights when there is a heat demand and is extinguished when the heat demand is no longer present.

**Space heating water temperature knob (→ fig. 51, [8]):**

The Space heating water temperature knob is used to set the upper space heating water temperature limit. The unit is °F.

**Display (→ fig. 51, [9]):**

The appliance display values, display settings and display codes can be read out from the display. If a fault occurs the display will immediately show the accompanying fault code. The fault code flashes if a locking fault has occurred.
**DHW temperature knob** (*→ fig. 51, [10]*)

The DHW temperature knob is used to select the required temperature of the hot water in the hot water cylinder. The unit is °F (*→ page 20, page 38).

**LED “DHW demand”** (*→ fig. 51, [11]*)

The LED “DHW status” lights when there is a DHW request and is extinguished when the DHW demand is no longer present.

### 8.2 BC10 operating instructions

You can navigate through the menu structure of the boiler on the BC10 using the “Reset” button, the “Chimney sweep” button, the “Service button” (*→ fig. 51, [2, 3 and 4]*) and the display (*→ fig. 51, [9]*)

The menu structure consists of 5 menus:
- **Normal Operation menu**, *→ table 11*
- **Flue Gas Test menu**, *→ table 12*
- **Service Mode menu**, *→ table 13*
- **Manual Operation menu**, *→ table 14*
- **Settings menu**, *→ table 15*

Table **13 Service mode**
Step 1
[1/2/0] Shows currently measured space heating water temperature in °F (§ 13.3, page 45).

Step 2
To activate manual operation: Press and hold the  button for more than 5 seconds.

Step 3
[1/5] A flashing dot in the right-hand bottom corner of the display shows manual operation is active. This means that the boiler is permanently in heating mode: Space heating water temperature is as set on the BC10 basic controller. The LED “Heating system status” lights. DHW mode is possible during manual operation.

Step 4
Press the  button.

Step 5

Step 6
Press the  button.

Step 7
[1/-/-] Display code. Operating phase (§ 13.5, page 46). The boiler is in manual operation mode. During manual operation the “Settings” menu (table 15 from step 2) can be used to temporarily change the target boiler performance.

NOTE: If the boiler output has been changed temporarily, this must be set again after ending manual operation, according to the “Settings” menu (table 15, page 30).

Step 8
Press the  button.

Step 9
[1/2/0] Shows currently measured space heating water temperature in °F (§ 13.3, page 45).

Step 10
After a power interruption manual operation ends automatically.

To end manually press and hold the  button for more than 2 seconds until the dot disappears.

**Table 14 Manual operation**

Step 1
[1/2/0] Shows currently measured space heating water temperature in °F (§ 13.3, page 45).

Step 2
To open the “Settings” menu: Press and hold the  +  buttons for more than 2 seconds.

Step 3
[L - -] This shows the “Settings” menu is open. You can adjust the setting of this parameter.

Step 4
[L - -] Target output. Adjust as follows, or go to step 5.

Lower: Decrease the modulation rate with the  button. The minimum setting for boilers with low BTU is [L 36] = 36% with an 80 kW boiler and [L 30] = 30% with a 100 kW boiler.

Higher: Increase the modulation rate with the  button. The maximum setting is [L - -] = 100%. This is equal to the factory setting.

Step 5
Press the  button.

Step 6
[f/6/0] Pump run-over time in minutes (starts when the heating mode has ended). Adjust as follows or go to step 7.

Lower: Decrease the time with the  button. The minimum setting is [f/0] = 0 minutes. The factory default setting is 5 minutes.

CAUTION! Do not set the post purge time to less than 5 minutes.

Higher: Increase the time with the  button. The maximum setting is [f/6/0] = 60 minutes or [f/1/d] = 24 hours.

Step 7
Press the  button.

Step 8
[c/1/1] DHW mode status setting. Adjust as follows or go to step 9.

DHW mode can be switched OFF or ON. This setting has priority over other DHW mode settings, such as those made on the room thermostat. Set the DHW mode with the  or  buttons. [c/1/1] means “ON”, [c/1/0] means “OFF”.

NOTE: Setting [c/1/0] also switches OFF the hot water cylinder frost protection.

Step 9
After 5 seconds or after a power interruption the settings menu ends automatically. To end manually press the  button.

Any adjustments that you have made have been confirmed.

**Table 15 Settings**
9 Start-up procedure

There are several steps involved in starting up the boiler. Complete the commissioning record log book after carrying out all activities described in this chapter (§ 15.1, page 53).

FOR YOUR SAFETY READ BEFORE OPERATING

WARNING: If you do not follow these instructions exactly, a fire or explosion may result causing property damage, personal injury or loss of life.

A. This appliance does not have a pilot. It is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.

B. BEFORE OPERATING: smell all around the appliance area for gas. Be sure to smell next to the floor because some gas is heavier than air and will settle on the floor.

WHAT TO DO IF YOU SMELL GAS

• Do not try to light any appliance.
• Do not touch any electric switch; do not use any phone in your building.
• Immediately call your gas supplier from a neighbor's phone. Follow the gas supplier's instruction.
• If you cannot reach your gas supplier, call the fire department.

C. Use only your hand to push in or turn the gas control knob. Never use tools. If the knob will not push in or turn by hand, don't try to repair it, call a qualified service technician. Force or attempted repair may result in a fire or explosion.

D. Do not use this appliance if any parts have been under water. Immediately call a qualified service technician to inspect the appliance and to replace any part of the control system and any gas control which has been under water.

OPERATING INSTRUCTIONS

1. STOP! read the safety information above on this label.
2. Turn off all electric power to the appliance.
3. Set the thermostat or other operating control to lowest setting.
4. This appliance is equipped with an ignition device which automatically lights the burner. Do not try to light the burner by hand.
5. Close main gas shut off valve.
6. Wait (5) minutes to clear out any gas. Then smell for gas. Including near the floor. If you smell gas, STOP! Follow “B” in the safety information above on this label. If you don't smell gas, go to the next step.
7. Open main shut off valve.
8. Set the thermostat or other operation control to desired setting.
9. Turn on all electric power to the appliance.
10. If the appliance will not operate, follow the instruction "To Turn Off Gas To Appliance" and call your service technician or gas supplier.

TO TURN OFF GAS TO APPLIANCE

1. Turn off all electric power to the appliance if service is to be performed.
2. Set the thermostat or other operating control to lowest setting.
3. Close main gas shut off valve.

Fig. 52 Safety sticker
Start-up procedure

9.1 Check for gas leaks
Prior to the initial start-up check that the gas flow pipe work is gas-tight; this must be confirmed in the start-up report.

**WARNING:**
- The boiler and its manual gas shutoff valve must be isolated from the gas supply piping system during any pressure testing of that system, exceeding 0.5 psi (34.5 mbar). The maximum test pressure allowed at the manual gas shutoff valve inlet is 0.5 psi (34.5 mbar).
- Cover endangered positions before leak testing.
- Do not spray the leak testing agent onto cables, plugs or electrical connection lines. Do not allow it to drip onto them either.

**DANGER:**
Leaks may be caused to pipes and screw connections during commissioning and maintenance activities.
- Carry out a proper leak test.
- Only use approved leak detection agents for leak detection.

- If 0.5 psi (34.45 mbar) or less, slowly open the gas valve by pushing on the gas valve and turning it ¼ rotation in a counter-clockwise direction (fig. 53). The gas valve is open when it is in the vertical position.
- Shut off the appliance from the power supply.
- Check the new conduit section up to and including its connection (i.e. direct sealing location) to the gas fitting for leaks, using a foaming product. The maximum test pressure allowed at the manual gas shutoff valve inlet is 0.5 mbar (0.2" W.C.).

**NOTICE**
- At initial start up, the boiler will start as soon as the system pressure exceeds 15 psi (1.0 bar).
- If the system pressure falls below 3 psi (0.2 bar) the boiler will stop and generate a fault code.

Push and open the control panel cover.
- Turn the Space heating water temperature knob [8] and DHW temperature knob [10] counterclockwise to the “0” position.

Fig. 53 Open the gas valve

1. pressure relief valve
2. supply water valve
3. pump
4. manual gas shutoff valve
5. return water valve

9.2 Fill the heating system
To ensure a trouble-free operation of the boiler, read the accompanying instructions about water quality, before filling the heating system.

**WARNING:**
- The boiler and its manual gas shutoff valve must be isolated from the gas supply piping system during any pressure testing of that system, exceeding 0.5 psi (34.5 mbar). The maximum test pressure allowed at the manual gas shutoff valve inlet is 0.5 psi (34.5 mbar).

**DANGER:**
Leaks may be caused to pipes and screw connections during commissioning and maintenance activities.
- Carry out a proper leak test.
- Only use approved leak detection agents for leak detection.

- Shut off the appliance from the power supply.
- Check the new conduit section up to and including its connection (i.e. direct sealing location) to the gas fitting for leaks, using a foaming product. The maximum test pressure allowed at the manual gas shutoff valve inlet is 0.5 mbar (0.2" W.C.).

**NOTICE**
- At initial start up, the boiler will start as soon as the system pressure exceeds 15 psi (1.0 bar).
- If the system pressure falls below 3 psi (0.2 bar) the boiler will stop and generate a fault code.

Push and open the control panel cover.
- Turn the Space heating water temperature knob [8] and DHW temperature knob [10] counterclockwise to the “0” position.

Fig. 54 BC10 basic controller
- Turn the vent key a quarter rotation to undo the boiler door lock (fig. 55, detailed picture). Push the fastener down (fig. 55, step 2) and open the boiler door.
- Remove the insulation cover of the pump group (fig. 55, step 4).

Fig. 55 Opening the boiler door
To purge the boiler, every radiator in the heating system must have a purge facility. In some situations it may even be necessary to provide extra purging facilities at certain locations. The boiler itself has an automatic air vent.
Loosen the cap of the automatic air vent (→ fig. 56) by turning ¼ rotation counterclockwise.

Fig. 56 Opening the automatic air vent

Open the heating supply and return isolating valves on the pump group (→ fig. 57). The open position is parallel to the pipe.

Fill the heating system to a pressure of about 20 psi (1.5 bar)

Fig. 57 Opening the isolating valves (here: open position)

Read the pressure (PSI) from the pressure gauge on the pump group or on the control panel of the BC10 (→ fig. 58).

The pressure in the heating system, which is measured directly at the boiler, must be at least equal to the required pre-pressure of the expansion vessel plus 7 psi (0.5 bar). This minimum pressure must not be less than 12 psi (0.8 bar) (if the heating system is cold). The maximum pressure in the heating system, measured directly at the boiler, must not exceed 30 psi (2.6 bar) or 50 psi (3.5 bar) when the optional 50 psi (3.5 bar) pressure relief valve is used.

Purge the heating system via the air vents on the heating bodies. Start at the lowest floor of the premises and then work your way up from floor to floor.

9.3 Fill the condensate trap with water

Fill the condensate trap with water (→ fig. 59). For disconnecting the condensate trap (→ § 12.3.5, page 43).

Fig. 59 Filling the condensate trap with water

WARNING:
Danger of fatal accident due to poisoning.
If the condensate trap is not filled with water, flue gas can escape and put people’s lives at risk.

9.4 Bleed the gas supply valve

Close the gas valve (→ fig. 60).

Fig. 60 Closing the gas valve
Start-up procedure

- Open the screw plug on the testing nipple of the gas supply pressure and for purging [1] by 2 turns and install a hose.

Fig. 61 Bleeding the gas flow pipe

- Slowly open the gas valve by pushing on the gas valve and turning it counterclockwise through ¼ rotation (→ fig. 62). The gas valve is open when it is in the vertical position.

Fig. 62 Opening the gas valve

- Purge the gas supply into a well ventilated area.
- Close the gas shutoff valve when no more air is present (→ fig. 60).
- Remove the hose and tighten the screw plug on the testing nipple again.

NOTICE
- Test the tightness of the measuring nipple(s) used.

9.5 Check the air/flue gas connection
Check the following points:
- Is the prescribed flue gas system used (→ § 6.8, page 16)?
- Have the configuration instructions from the relevant flue gas system installation instructions been observed?

9.6 Checking the appliance configuration

NOTICE
- The burner must only be put into use with the correct orifice (→ table 16).
  - Consult the relevant gas utility company for the type of gas supply.
  - Check that the actual gas supply is in accordance with the type of gas supply specified on the gas classification label (→ fig. 63).

Fig. 63 Checking the gas classification label

Table 16 Gas orifice diameter

9.7 Measure the gas inlet pressure (working pressure)
- Open at least 2 radiator valves, if present. Do not switch ON the boiler.
- Push on the control panel to open it.
- Switch OFF the power supply to the appliance.
- Close the gas valve in a clockwise direction (→ fig. 64).

Fig. 64 Closing the gas valve

- Turn the vent key through a quarter rotation to undo the boiler door lock (→ fig. 55, page 32).
- Push the fastener down and open the boiler door.
Start-up procedure

- Open the screw plug on the testing nipple for the gas inlet pressure by 2 turns (fig. 65, [1]).

![Fig. 65 Measuring the gas supply pressure](image)

- Reset the digital pressure gauge to “0”.

**NOTICE**
- Throughout the measuring operation, keep the digital pressure gauge in the same position (horizontal or vertical) in which it was reset to “0”.

- Connect the pressure gauge connection tube to the positive port of the testing nipple (fig. 65, [2]).
- Slowly open the gas valve by pushing on the gas valve and turning it ¼ rotation in a counterclockwise direction (fig. 62, page 34).
- The gas valve is open when it is in the vertical position.
- Switch ON the appliance by pressing the main switch of the BC10 basic controller (fig. 66, [1]).
- Press and hold the “Chimney sweep” button (fig. 66, [3]) (approx. 2 seconds), until the dot in the right-hand bottom corner of the display (fig. 66, [9]) appears (table 12, page 29).
- After the LED “Burner operation” (fig. 66, [6]) has lit up wait for 1 minute until the boiler is burning at full load.
- Statically measure the gas supply pressure and enter it in the start-up report (§ 15.1, page 53).

To obtain the best performance of the appliance, the gas supply pressure must be:

<table>
<thead>
<tr>
<th>Statically measured gas supply pressure</th>
<th>Natural gas inch W.C. (mbar)</th>
<th>LPG inch W.C. (mbar)</th>
</tr>
</thead>
<tbody>
<tr>

<td>10,5 (26.1)</td>
<td>13 (32.3)</td>
</tr>
</tbody>
</table>

**Table 17 Gas supply pressure**

1) Measured statically perpendicular to flow at full load.

- Press the “Service” button (fig. 66, [4]) repeatedly until the temperature reading is shown in the display.

- Press the “Chimney sweep” button (fig. 66, [3]) to clear the reading (table 12, page 29).

**WARNING:**
A leaking testing nipple causes explosive fumes.
- Check the testing nipples used for leaks.
- Only use approved detection products to locate leaks.

**NOTICE**
- If the supply pressure is too low, check the gas supply pipe or contact the relevant gas utility company if the required supply pressure is not available.
- If the supply pressure is too high, a gas pressure regulator must be integrated upstream of the gas fitting. Contact the gas utility company.

- Close the gas valve.
- Remove the gauge-connection tube and tighten the screw plug on the testing nipple again.
- Open the gas valve again by pushing on the gas valve and turning it ¼ rotation in a counterclockwise direction.

**9.8 Carry out a leakage test in operating conditions**

**WARNING:**
Leaks may be caused to pipes and screw connections during commissioning and maintenance activities.
- Carry out a proper leak test.
- Only use approved leak detection agents for leak detection.

- Press and hold the “Chimney sweep” button (fig. 66, [3]) (approx. 2 seconds), until the dot in the right-hand bottom corner of the display (fig. 66, [9]) appears (table 12, page 29).
- After the LED “Burner operation” (fig. 66, [6]) has lit up wait for 1 minute until the boiler is burning at full load.
Start-up procedure

- Use a foaming product to check all sealing locations in the total gas circuit of the burner while the burner is active.
- Press the “Chimney sweep” button (fig. 66, [3]) to clear the reading (table 12, page 29).

9.9 Check and adjust the flue gases CO₂ emissions

**CAUTION:**
Take adequate time to properly measure the CO₂ values.
- Changes will only be measurable after about 1 minute.
- Let the CO₂ value stabilize for about 30 seconds before reading and/or readjusting.

- Open at least 2 radiator valves, if present. Do not switch ON the boiler.
- Push on the control panel to open it.
- Switch OFF the appliance by pressing the main switch of the BC10 basic controller (fig. 66, [1]).
- Remove the cover from the flue gas measuring point (fig. 67, [1]).
- Connect the flue gas analyzer to the left-hand measuring point, insert it roughly 2” (fig. 67).

**Fig. 67 Measuring the flue gases CO emissions**

- Switch ON the appliance by pressing the main switch of the BC10 basic controller.
- Press and hold the button (fig. 70, [3]) (approx. 2 seconds), until the dot in the right-hand bottom corner of the display (fig. 70, [9]) appears (table 12, page 29).
- After the “LED Burner operation” (fig. 70, [6]) has lit wait for 1 minute until the boiler is burning at full load.
- Measure in the flue gas measuring port, with closed boiler door, the CO₂ percentage. The value has to be 9.3% ± 0.2%.
- If necessary: open the boiler door and adjust the CO₂ percentage to 9.3% by means of the adjustment screw on the gas valve with the red sleeve (fig. 68) and close boiler door again. Note the set value in table 27 on page 53.

If the CO₂ percentage is not adjustable above 9% the problem can be:
- The gas pressure is too low (§ 9.7, page 34).
- CO₂ analyzer set incorrectly. Set CO₂ analyzer on natural gas.
- Very low calorific gas. No solution, accept lower CO₂ percentage.

**NOTICE**
- The adjustment screw has no limit stop, there for it is not defined, in advance, that turning left or right will give a higher or lower value.

- Simultaneously press and hold the + buttons for more than 2 seconds, to activate service mode for partial load setting.
- Press and hold the button until the display shows:
  - L36 with a 80 kW boiler or
  - L30 with a 100 kW boiler.
- After the load is adjusted to partial load, wait for 1 minute until the boiler burns at partial load.
- Measure in the flue gas measuring port the CO₂ percentage. The value has to be 1 to 1.5% lower than the measured value at full load.

E.g. full load measured value = 9.3:
9.3 · 1 = 8.3 and 9.3 · 1.5 = 7.8
So when the CO₂ percentage at full load is 9.3%, the partial load CO₂ percentage value has to be between 8.3% and 7.8%.

If necessary:
- Adjust the CO₂ percentage to the calculated value, by means of the air/gas ratio adjustment screw [1]. The adjustment screw is located behind the screw plug.
- Open the screw plug.
- Turn adjustment screw to the left for a lower CO₂ percentage.
- Turn adjustment screw to the right for a higher CO₂ percentage.
- After adjusting close the screw plug.

**Fig. 69 Adjusting gas/air ratio at minimum load**
- Note the set value in table 27 on page 53.
Start-up procedure

▶ Switch OFF the heating system by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Remove the flue gas analyzer and fit the cover back onto the flue gas measuring point (\(\rightarrow\) fig. 70, [1]).
▶ Switch ON the heating system by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Press on the control panel to close it.

9.10 Function test
▶ During initial start-up and annual inspection and/or needs-oriented servicing, make sure that all control, regulating and safety devices are in full working order and, if applicable, check them for correct adjustment.
▶ The gas and water circuits must be tested for leaks (\(\rightarrow\) § 9.1, page 32), (\(\rightarrow\) § 9.9, page 36).

9.11 Measure the ionization current
▶ Press on the control panel to open it.
▶ Open at least 2 radiator valves, if present. Do not switch ON the boiler.
▶ Switch OFF the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).

▶ Turn the vent key through a quarter turn to undo the boiler door lock (\(\rightarrow\) fig. 55, step 1).
▶ Push the fastener down (\(\rightarrow\) fig. 55, step 2) and open the boiler door.
▶ Undo the plug and socket connection of the monitoring cable (\(\rightarrow\) fig. 71).

▶ Connect the multi meter in series (\(\rightarrow\) fig. 72). Select the \(\mu\text{A DC}\) range on the multi meter. The multi meter must have a resolution of at least 1 \(\mu\text{A}\).

▶ Switch ON the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Activate the Service mode in accordance with the “Service mode” menu (\(\rightarrow\) table 13, page 29).
▶ Set the capacity to minimum (part load) according to the “Service mode” menu (\(\rightarrow\) table 13, page 29).
▶ After the LED Burner “operation” (\(\rightarrow\) fig. 70, [6]) has lit wait for 1 minute until the boiler is burning at part load.
▶ Measure the ionization current. The ionization current must be \(> 5 \mu\text{A DC}\) at part load operation.
▶ Enter the result in the start-up report (\(\rightarrow\) § 15.1, page 53).
▶ If the result is not as it should be (\(\rightarrow\) § 9.9, page 36) or check the ionization electrode (\(\rightarrow\) § 12.3.4, page 42).
▶ Press and hold the “Chimney sweep” button (\(\rightarrow\) fig. 70, [3]) (approx. 2 seconds), until the dot in the right-hand bottom corner of the display (\(\rightarrow\) fig. 70, [9]) appears (\(\rightarrow\) table 12, page 29).
▶ Switch OFF the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Remove the multi meter and reconnect the monitoring cable.
▶ Switch ON the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Check that the boiler performance is still at the required value (\(\rightarrow\) table 13, page 29).

9.12 Test the Ignition Safety shut off device
▶ Switch OFF the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Disconnect the plug and socket connection of the monitoring cable.
▶ Switch ON the appliance by pressing the main switch of the BC10 basic controller (\(\rightarrow\) fig. 70, [1]).
▶ Press the “Chimney sweep” button and hold it (for approx. 2 seconds), until the display shows the decimal point.
▶ Check if the boiler does 1 start-up attempt and 3 restart attempts.
   After each start-up attempt the boiler will signal a start-up failure.
   A “6A” code can be seen in the display.
   After the last start-up attempt, the boiler will lock out. The “6A” code is blinking in the display.
▶ Connect the plug and socket connection of the monitoring cable.
▶ Press the “Reset” button.
▶ Check if the boiler starts up.
▶ Press the “Chimney Sweep” button return to normal operating conditions.
9.13 **Boiler settings**

9.13.1 **Set the heating capacity**
- Set the required heating capacity on the BC10 according to the “Settings” menu. See table 18, when making these settings.

<table>
<thead>
<tr>

</tr>
<tr>
<td>Aut</td>
<td>The temperature is determined automatically on the basis of the heating curve. If no room controller is connected, the maximum supply temperature is 180 °F (82 °C).</td>
</tr>
</tbody>
</table>

*Table 19 Setting of the “space heating water temperature”*

9.13.3 **Set the pump run-over time**
- Set the pump run-over time according to the “Settings” menu (table 15, page 30).

If the heating system is room temperature controlled, and not controlled parts of the heating system risk freeze damage (e.g. radiators in the garage), set the pump run-over time to 24 hours.

9.13.4 **Switch DHW mode ON/OFF**
- Set the DHW mode according to the “Settings” menu (table 15, page 30).

When DHW-mode is switched OFF (C), the freeze protection for the hot water cylinder (if present) is switched OFF.

9.13.5 **Set the DHW temperature**
- Set the DHW temperature knob (fig. 73, [10]) to the required temperature of the hot water in the hot water cylinder (table 20).

<table>
<thead>
<tr>
<th>Knob position</th>

</tr>
<tr>
<td>Aut</td>
<td>The temperature is set on the thermostat (e.g. RC35). If no thermostat is connected, the maximum DHW temperature is 140 °F (60 °C).</td>
</tr>
</tbody>
</table>

*Table 20 Setting of the “DHW temperature”*

9.14 **Final activities**

9.14.1 **Close the boiler door and the control panel**
- Close the boiler door (fig. 74) and lock the fastener by turning the vent screw through ¼ rotation in a clockwise direction.
- Push on the control panel to close it.

9.14.2 **Hand over**
- Hand over all relevant documentation to the end user and explain his/her responsibilities under the relevant national and regional regulations.
- Explain and demonstrate the start-up and shut down procedures.
10 Shutting down the system

CAUTION:
The heating system may freeze if it is not operational in times of freezing.

- Protect the heating system against freezing if there is a danger of frost affecting the system. Drain the heating system water from the lowest point of the heating system. The vent screw at the highest point of the heating system must then be open.

10.1 Shut down the appliance using the basic controller

Shut down your appliance by means of the Logamatic BC10 basic controller. When the system is shut down, the burner is automatically switched off.

Further information about the use of the BC10 basic controller is provided in chap. 8 “Operation”, page 28.

- Push on the control panel to open it.
- Switch OFF the appliance by pressing the main switch of the BC10 (→ fig. 73, [1]).
- Close the main gas supply or the gas valve (→ fig. 75).

10.2 Shutting down the heating system if there is a risk of freezing (interruption of use)

If conditions are such that the heating system has to be shut down for a long period while there is a risk of freezing, the water must be drained from the heating system.

- Push on the control panel to open it.
- Switch OFF the appliance by pressing the main switch of the BC10 (→ fig. 73, [1]).
- Close the main gas supply or the gas valve (→ fig. 75).

- Drain the heating water at the lowest point of the heating system, using the drain cock or the heating body (→ fig. 76). The (automatic) air vent at the highest point of the heating system/radiator must be open.

Fig. 76 Draining the heating system (example)

10.3 Shutting down the heating system in the event of an emergency

You must immediately close the main shutoff valve or gas shutoff valve and disconnect the power from the appliance.

- Close the main shutoff valve.

11 Inspection

Offer your customer an annual inspection and maintenance contract. The activities to be included in an annual inspection and maintenance contract can be found in the inspection (→ § 15.2, page 54) and service reports (→ § 15.3, page 55).

CAUTION:
Periodically examine the venting systems and cleaning of the screens in the vent terminal.

- Also periodically inspect the low water cutoffs, including flushing of float types and clean the condensate collections and disposal system.
11. Prepare the appliance for inspection

11.1 Prepare the appliance for inspection

**INSTRUCTION FOR THE INSTALLER**

- If gas pipes have to be disconnected from the gas burner fitting, the burner cover must only be opened by a specialized professional.

- Switch OFF the appliance by pressing the main switch of the BC10.
- Close the gas valve [1].
- Close the isolating valves [2].

![Fig. 77 Closing the valves (here: in closed position)](image)

- Open the boiler door:
  - Turn the vent key through a quarter rotation to undo the boiler door lock (→ fig. 78, step 1).
  - Push the fastener down (→ fig. 78, step 2) and open the boiler door.

**NOTICE**

- If the boiler door cannot be opened completely, remove it (→ § 12.2, page 41).

![Fig. 78 Opening the boiler door](image)

11.2 Carry out a visual check for general signs of corrosion

- Check all gas and water-bearing pipes for signs of corrosion and for leaks.
- Replace any pipes that are corroded.
- Carry out a visual inspection of the burner, heat exchanger, condensate trap, automatic air vent and all fittings in the boiler.

11.3 Gas valve leakage test

- Check the internal tightness of the gas fitting on the input side (with the boiler switched OFF) at a test pressure of 7.0” W.C. (17.4 mbar) for natural gas and 8.0” W.C. (19.9 mbar) for LPG.
- Check that the appliance is switched OFF.
- Open the screw plug on the testing nipple for the gas connection by 2 turns (→ fig. 79, [1]).
- Connect the pressure gauge tube to the testing nipple (→ fig. 79, [2]). The pressure drop allowed after 1 minute is max. 3.8” W.C. (10 mbar).
- If the pressure drop is higher, check all sealing locations of the gas fitting for leaks using a foaming product. Repeat the pressure test if no leaks are found. Replace the gas fitting if the pressure drop is higher than 3.8” W.C. (10 mbar) per minute again. See § 12.3.2 "Remove the burner cover with the fan and the gas valve", page 42 for instructions on how to remove.

![Fig. 79 Checking the gas fitting for internal tightness](image)

11.4 Measure the ionization current (→ § 9.11, page 37).

11.5 Measure the gas inlet pressure (working pressure) (→ § 9.7, page 34).

11.6 Check and adjust the flue gas CO₂ emissions (→ § 9.9, page 36).

11.7 Carry out a leakage test in operating conditions (→ § 9.8, page 35).

11.8 Measure the flue gases CO₂ emissions (→ § 9.9, page 36).

11.9 Fill the heating system

To ensure a trouble free operation of your boiler check the pH-value every year and correct it, if necessary. See accompanying manual about water quality for more information (→ § 9.2, page 32).

11.10 Check the air/flue gas connection (→ § 9.5, page 34).
12 Maintenance

**CAUTION:**
Risk of electric shock.
- Before opening the appliance: disconnect the appliance from the power supply using the appliance emergency OFF button or disconnect the relevant circuit breaker of the house from the power grid.
- Secure the appliance against accidental restarting.

**INSTRUCTION FOR THE INSTALLER**
- Record the activities in the service report (§ 15.3, page 55).

**NOTICE**
- There is no need to lubricate the combustion motor as it is permanently lubricated.

12.1 Prepare the heating system for maintenance

**INSTRUCTION FOR THE INSTALLER**
- If gas pipes have to be disconnected from the gas burner fitting, the burner cover must only be opened by a specialized professional.

- Switch OFF the appliance by pressing the main switch of the BC10.
- Close the gas valve [1].
- Close the isolating valves [2].

**CAUTION:**
Risk of electric shock.
- Before opening the appliance: disconnect the appliance from the power supply using the appliance emergency OFF button or disconnect the relevant circuit breaker of the house from the power grid.
- Secure the appliance against accidental restarting.

**INSTRUCTION FOR THE INSTALLER**
- Record the activities in the service report (§ 15.3, page 55).

**NOTICE**
- The cover over the electrical connections does not have to be removed from the boiler.

12.2 Remove the boiler door

- Unscrew the control panel from the boiler door and hang it on the boiler frame (§ 13.1, page 45).
- Unscrew the bolt from left-hand top hinge of the boiler door and remove it together with the washer (fig. 81).
- Slightly lift the door and pull it from the hinge.
- Put the door upright in a safe position.

**CAUTION:**
Risk of electric shock.
- Do not spray the cleaning agent onto the burner, the hot surface ignitor, the ionization electrode or other electric components.

**NOTICE**
- There is no need to lubricate the combustion motor as it is permanently lubricated.

12.3 Clean the heat exchanger, burner and condensate trap

The boiler heat exchanger has a self-cleaning coating.

**INSTRUCTION FOR THE INSTALLER**
- Record the activities in the service report (§ 15.3, page 55).

**NOTICE**
- The cover over the electrical connections does not have to be removed from the boiler.

12.3.1 Remove the gas valve

- Undo the gas fitting screw connection [1] and pull the 4 connectors [2] from the gas valve.

**CAUTION:**
To avoid a short circuit.
- Do not spray the cleaning agent onto the burner, the hot surface ignitor, the ionization electrode or other electric components.
12.3.2 Remove the burner cover with the fan and the gas valve

- Pull the mains connector [1] from the fan.
- Pull the connector of the harness [2] from the fan while pushing on the connector lock to loosen it.

![Fig. 83 Removing the connectors from the fan]

- Pull the air suction tube from the fan (→ fig. 84).

![Fig. 84 Pulling the air suction tube from the fan]

- Carefully open the 4 snap retaining clips on the burner cover (→ fig. 85). The retaining clips may be under tension.
- Remove the retaining clips.

![Fig. 85 Opening the retaining clips]

- Remove the burner cover with the gas/air unit (→ fig. 86).

![Fig. 86 Removing the burner cover with the gas/air unit]

12.3.3 Remove the burner and the burner seal

- Remove the burner seal [1] and replace it if necessary.
- Remove the burner plate [2] and clean it on all sides using compressed air or a soft brush.

When re-installing the burner plate make sure that the notch is on the right-hand side (→ fig. 87, detailed picture).

![Fig. 87 Removing the burner plate and the burner seal]

12.3.4 Checking ignition unit

**DANGER:**
- Close the gas valve prior to working on components in contact with gas.
- Check for gas tightness after carrying out work on components in contact with gas.

**NOTICE**
The glow ignitor is fragile.
- Handle with care.

**NOTICE**
If the seat of the cover plate leaks, the seal can burn away.
- Check the cover plate for tightness.
12.3.5 Disconnect the condensate trap

- Disconnect the condensate trap hose [3] and the rubber sleeve [2] from the condensate trap [1].
- Turn the condensate trap a quarter rotation counterclockwise (➔ fig. 90).

**NOTICE**

Since the effectiveness of the seals in the ignition unit is reduced, the gas condensing boiler may become damaged.

- The rubber seal (➔ fig. 89, [3]) and the cover plate with seal (➔ fig. 89, [4]) need to be replaced every 4 years.

- Check the individual components of the ignition unit (➔ fig. 89) for wear or contamination (➔ fig. 88).
- If required, replace the ionization electrode and/or glow ignitor.
- After checking or replacing the ionization electrode and/or the glow ignitor fit a new cover plate and rubber seal.

**Fig. 88  Checking the ionization electrode**

**Fig. 89  Replacing the ignition unit**

1. glow ignitor
2. Ionization electrode
3. Rubber seal
4. Cover plate with seal
5. Nut

**Fig. 90  Disconnecting the condensate trap hose**

1. Condensate trap
2. Rubber sleeve
3. Condensate trap hose

- Disconnect the condensate trap from the coupling and remove it [1].

**Fig. 91  Disconnecting the condensate trap**

- Rinse the condensate trap to clean it.
- Fill the condensate trap with water and reinstall it.

**NOTICE**

- The condensate trap has a bayonet connector. After inserting it, the condensate trap must be turned ¼ rotation clockwise to click into position.
12.3.6 Remove the condensate collector

- Disconnect the flexible condensate drain hose and bend it backwards (⇒ fig. 92).

![Fig. 92 Removing the condensate trap hose](image)

- Open the 2 clamps on the right and left at the bottom of the condensate collector [1].
- Pull the condensate collector down [step 1] and remove it by pulling it towards you [step 2].

![Fig. 93 Removing the condensate collector](image)

- Check the condensate collector for damage and replace it if required.
- Clean the condensate collector mechanically (using compressed air or a soft brush) and rinse it with clean water (⇒ fig. 94).

![Fig. 94 Cleaning the condensate collector](image)

12.3.7 Clean the heat exchanger

**CAUTION:** Incorrect handling can damage the boiler.

- Do not use metal brushes or similar hard cleaning tools.
- Handle the glow ignitor with care, it is made from fragile ceramic material.
- Cover the boiler interior using a blanket or a cover to prevent dirt entering the boiler.

**WARNING:** If the condensate collector is installed incorrectly.

- Flue gas or condensate may leak

- Clean the heat exchanger with compressed air or a soft brush (⇒ fig. 95).

![Fig. 95 Cleaning the heat exchanger](image)

- Refit the condensate collector and make sure that the 2 retaining clips close smoothly. If this is not the case, the seal between the condensate collector and the flue pipe at the rear side of the heat exchanger may be leaking.
- Connect the flexible condensate drain hose to the condensate collector.
- Re-install the condensate trap.
- Rinse the heat exchanger with clean water.
- Reassemble all boiler components in reverse order:
  - Burner with burner seal,
  - Burner cover with fan and gas valve,
  - Gas valve,
  - Glow ignitor and ionization electrode.
- Start up the boiler (⇒ chap. 9 “Start-up procedure”, page 31).

12.4 Check and adjust the flue gases CO₂ emissions

(⇒ § 9.9, page 36)

12.5 Function check

- Slowly open the gas valve by pushing on the gas valve and turning it ¼ rotation in an counterclockwise direction.
- Switch ON the appliance by pressing the main switch on the BC10 basic controller [1]).
- Set the space heating water temperature knob [8] and the DHW temperature knob [10] to the maximum temperatures.
- Enter a heat demand via the control unit and check that the boiler starts the heating mode.
13 Display information

13.1 Removing the control panel

To make it easier to use the buttons on the control panel when the boiler door is open and to make it easier to read the values in the display, you can disassemble the control panel from the boiler door and hang it from the boiler frame.

- Open the boiler door.
- Loosen the 2 screws of the control panel at the rear side of the boiler door [1].

13.2 Replacing the control panel

- Take the control panel from the boiler frame.
- Install the control panel in the boiler door by following the procedure in § 13.1 "Removing the control panel", page 45 in reverse order.

#### 13.5 BC10 Display codes

The following table contains all codes that can show on the BC10 display. To show the current display code and/or sub code, press the "Service" button repeatedly.

There are 3 main code groups:

- **Operating codes** - this code gives the status of the boiler. No action is necessary.
- **Locking faults** - the boiler resumes normal operation when the fault has cleared.
- **Blocking faults** - the boiler is locked and will only restart after a manual reset. The pump will operate continuously for frost protection.

If a blinking code is displayed together with other codes, all displayed codes will blink. A locking code will always show on the first screen of the BC10.

#### Heating

| **Maximum flow temperature** | °F (°C) | 180 (82) |
| **Maximum working pressure (boiler)** | psi (bar) | 50 (3.6) |
| **Minimum water circulation volume** | Gal/h (l/h) | 0 |
| **Flow temperature** | °F (°C) | 86-180 (30-82), can be set on the BC10 basic controller |
| **Resistance at ΔT = 20 K** | psi (bar) | 3.26 (225) |
| **Heating circuit volume of heat exchanger** | Gal l | 1.3 (5.0) |

#### Pipe connections boiler, without pump group

| **Gas connection** | in | Rp 1" |
| **Heating water connection** | in | G 1½" union nut with female thread enclosed |
| **Condensate connection** | in (mm) | Ø 1¼" (32) |

#### Flue gas values

| **Condensate quantity at 104/86 °F (40/30 °C)** | Gal/h (L/h) | 2.4 (9.0) | 2.85 (10.8) |
| **pH value of condensate** | pH | approx. 4.1 |
| **Flue gas mass flow rate, full load** | g/s | 35.3 | 44.9 |
| **Flue gas temperature 176/140 °F (80/60 °C), full load** | °F (°C) | 153 (67) | 149 (65) | 169 (76) | 165 (63) |
| **Flue gas temperature 176/140 °F (80/60 °C), partial load** | °F (°C) | 142 (61) | 136 (58) | 142 (61) | 136 (58) |
| **Flue gas temperature 122/86 °F (50/30 °C), full load** | °F (°C) | 118 (48) | 114 (46) | 124 (51) | 120 (49) |
| **Flue gas temperature 122/86 °F (50/30 °C), partial load** | °F (°C) | 93 (34) | 88 (31) | 96 (34) | 88 (31) |
| **CO₂ content at full load** | % | 9.3 ± 0.2% | 9.6 | 9.4 ± 0.2% | 9.7 |
| **Free fan feed pressure** | " w.c. (Pa) | 0.602 (150) | 0.883 (220) |

#### Flue gas connection

| **Ø Flue gas system, room-air dependent** | in (mm) | Ø 4" (100) |
| **Ø Flue gas system, room-air independent** | in (mm) | Ø 4" (100)/4" (100) parallel |

#### Electrical data

| **Mains connection voltage** | VAC, Hz | 120, 60 |
| **Electrical protection rating** | IPX4D |
| **Fuses** | Amp | 5 |
| **Electrical power consumption, full load (without a pump group)** | W | 104 | 156 |
